Correct charging of electronic devices

To minimize the risk of fire in your residential areas, it is essential to follow good charging practices, especially for electric tools and bicycles, which can pose a significant fire risk.

Here are some simple but important tips:

Monitoring: Do not charge devices while you are sleeping or not at home.

Placement: Avoid charging on flammable materials such as a bed or sofa.

Temperature: The charger may become warm, but never very hot.

Ventilation: Ensure the charger is not covered so it can dissipate heat.

Timer: Use a timer to avoid prolonged charging.

Protection: Avoid mechanical damage to rechargeable batteries.

Proximity: Ensure that fire extinguishers are installed in close proximity to charging areas.

Charging Room: Charge devices in separate rooms (fire cells) with approved fire doors and smoke detection, if possible.

We encourage everyone to follow these tips to ensure the safety of yourself and your shared home. Together, we can work proactively to prevent fires and ensure a safer living environment for all.

Risk of Lithium-Ion Batteries

Electronic devices often contain lithium-ion batteries, which can pose a risk of explosion and fire, especially if they have been subjected to impact, shock, or over-charging. Pay particular attention to your devices while they are charging.
